CFP

REG = non-institutional owner

II = institutional owner

- TRG • Manulife
- Molpus • Lyne

REG = non-institutional owner, ^{no} sale

(REG) = " " , sale

II = institutional owner, no sale

(II) = " " , sale

 = > 20% disturbance to parcel

* I think we want to compare:

institutional owner ²⁰²⁰⁻²⁶ ~~2020-26~~ who sells → that/those owners' disturbances

to

institutional owner in same period who doesn't sell → that/those owners' disturbances

NOTE: TRG/Verdant sold many thousands of acres to American Songbird (a nonprofit) in 2026 → Emma has those parcels.

→ where "II" can either be all 4 institutional owners together (to understand Collective behavior, OR "II" could be split and analyzed by each owner separately (II1, II2, II3, II4).

→ This assumes we don't care about REG or (REG). bc these are oranges relative to II apples, BUT...

you could also compare (II) as a collective to (REG) as a collective to see if there's a difference... I believe you did this already?
